

BUSINESS REQUIREMENT DOCUMENT - IT PRODUCT SALES DASHBOARD

1. Project Overview

The Sales Dashboard is designed to provide visibility into the sales performance of IT products such as laptops, modems, and processing chips. It helps business stakeholders monitor key performance indicators including total sales quantity, revenue, profit, product returns, and loss due to returns.

The dashboard enables users to perform period-wise comparisons, identify top-performing and least-performing products, and analyze customer buying patterns across different product categories. This helps management make data-driven decisions to improve sales performance and business profitability.

2. Stakeholders

The following stakeholders will use or be impacted by the Sales Dashboard:

- **Sales Managers:** Monitor team and product performance, track revenue, and identify top and low-performing products.
- **Regional Sales Leaders:** Analyze sales performance across different regions and compare trends.
- **Business / Product Heads:** Understand overall product performance, customer demand patterns, and profitability.
- **Senior Management (CEO / Directors):** Review high-level business performance metrics for strategic decision-making.
- **Sales Executives:** Track their own sales performance and understand product demand trends.
- **Data / Business Analysts:** Maintain the dashboard, generate reports, and support business queries.

3. Business Requirements

The Sales Dashboard must provide the following business capabilities:

- The system shall display total sales quantity for IT products such as laptops, servers, modems, and processing chips.
- The system shall display total revenue generated from product sales.
- The system shall calculate and display total profit earned.
- The system shall track and display product returns and associated financial loss.
- The system shall support period-wise comparison (daily, monthly, quarterly, yearly) of sales performance.
- The system shall identify and display top-performing products based on sales and revenue.
- The system shall identify least-performing products based on sales.
- The system shall provide customer segmentation insights, showing which customer categories are buying which products.
- The system shall allow filtering of data based on product type, region, and time period.

4. Scope

4.1 In Scope (Included in this project)

- Sales performance tracking of IT products (laptops, modems, chips)
- Revenue, profit, and return analysis
- Product-wise performance comparison
- Period-wise analysis (daily, monthly, quarterly, yearly)
- Customer category-wise purchase analysis
- Regional sales performance tracking
- Interactive dashboard with filters (product, region, time period)

4.2 Out of Scope (Not included in this project)

- Direct sales transaction processing (order placement is not part of this dashboard)
- Inventory management system
- Payment gateway or billing system
- Real-time order fulfillment tracking

- Customer support or complaint management system

5. Assumptions & Constraints

5.1 Assumptions

- Sales data is available and accurately recorded in the source system.
- Product, customer, and regional data is properly maintained and updated.
- Data will be refreshed on a regular basis (daily or weekly).
- Users accessing the dashboard have a basic understanding of sales metrics and KPIs.
- Required historical data is available for trend analysis.

5.2 Constraints

- Data quality depends on the accuracy of source systems.
- Dashboard performance may be impacted with large volumes of historical data.
- Access to sensitive sales data will be restricted based on user roles.
- Real-time updates may not be available; data may have a scheduled refresh delay.
- Limited customization available based on predefined business requirements.

6. Success Criteria

The Sales Dashboard will be considered successful if the following conditions are met:

- Users can successfully view accurate sales, revenue, profit, and return data without errors.
- The dashboard provides clear visibility into top-performing and least-performing products.
- Period-wise comparisons (daily, monthly, quarterly, yearly) are correctly displayed.

- Customer buying patterns across product categories are clearly identifiable.
- Data refresh happens as per defined schedule without delays or failures.
- Stakeholders confirm that the dashboard meets their reporting and decision-making needs during UAT.
- The dashboard improves speed and efficiency of sales performance analysis compared to manual reporting.
